Pulsar Timing in Extreme Mass Ratio Binaries

Tom Kimpson w/, Kinwah Wu, Silvia Zane.

July 10, 2019

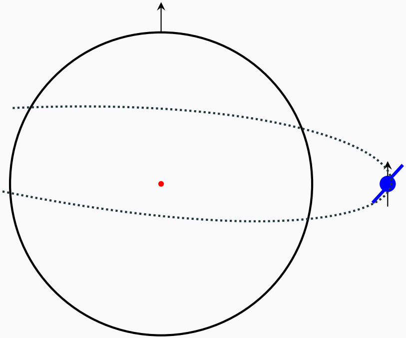
Mullard Space Science Laboratory, UCL

A Problem

GR is incomplete

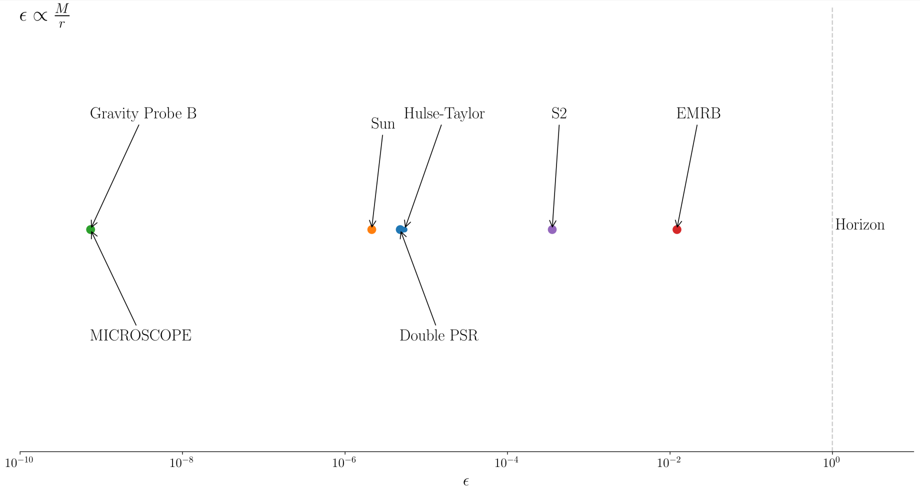
- Field equations = Non-unique
- Breaks down: Singularities + Quantum Gravity

PSR-EMRB



- Extreme Mass Ratio Binary (EMRB)
- Event Horizon Clock

A precision, strong-field probe



Scientific prospects

3 important parameters:

$$M, \chi, Q$$

Fundamental Physics

- No Hair Theorem ($Q = -\chi^2$)
- Cosmic Censorship Conjecture ($\chi \leq M^2$)

Astrophysics

- Astrophysical BH = Kerr solution?
- Constrain low end of $M - \sigma$ relation / Existence of IMBH

Hunting Grounds

- Galactic Centre
- Globular Clusters

Detection Prospects

- $\lesssim 10^4$ PSR at < 1 pc *(Wharton et al. 2012, ApJ 753:108, Rajwade et al. 2017, MNRAS 471:730)*
- Closest semi-major axis $\lesssim 100$ AU
- Closest pericentre distance ~ 2 AU *(Zhang et al. 2014, ApJ 784:106)*

Detection Prospects

- $\lesssim 10^4$ PSR at < 1 pc *(Wharton et al. 2012, ApJ 753:108, Rajwade et al. 2017, MNRAS 471:730)*
- Closest semi-major axis $\lesssim 100$ AU
- Closest pericentre distance ~ 2 AU *(Zhang et al. 2014, ApJ 784:106)*

No such PSR-EMRB yet detected!

This Work

Goal: Use the next-generation radio telescopes to time a pulsar in orbit around a massive central black hole.

Require theoretical basis for PSR Timing Signal

This Work: Why?

- Detection. *e.g. Are our algorithms good enough?*
- Modelling. *i.e. GR predictions vs. observation*

This Work: How?

Require theoretical basis for PSR Timing Signal

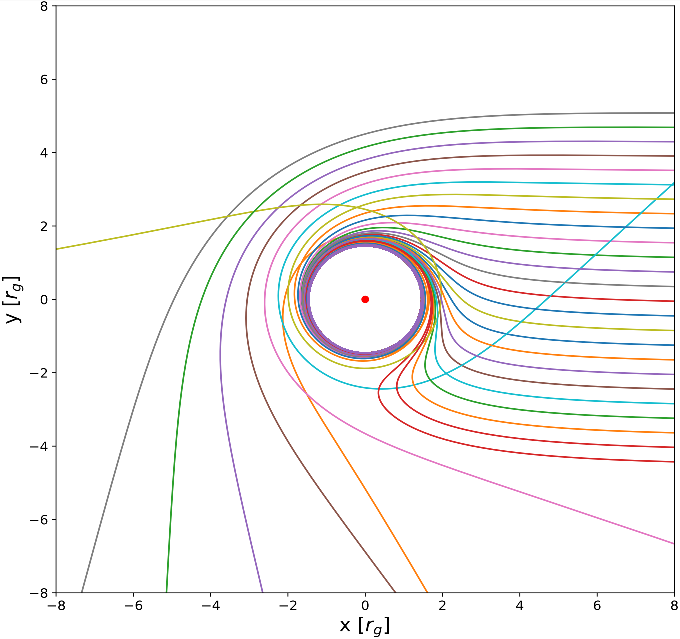
Behaviour of light + Orbital Dynamics = Timing signal

This Work: How?

Require theoretical basis for PSR Timing Signal

Behaviour of light + Orbital Dynamics = Timing signal

Ray Tracing



This Work: How?

Require theoretical basis for PSR Timing Signal

Behaviour of light + Orbital Dynamics = Timing signal

PSR Orbital Dynamics

- Textbook GR: point particles.
- Real pulsars $\neq$ point particles!

Creating the skeleton

$$T^{\mu\nu}{}_{;\nu} = 0$$

Multipole expansion to dipole order:

$$\frac{Dp^\mu}{d\tau} = -\frac{1}{2} R^\mu_{\nu\alpha\beta} u^\nu s^{\alpha\beta}$$

$$\frac{Ds^{\mu\nu}}{d\tau} = p^\mu u^\nu - p^\nu u^\mu$$

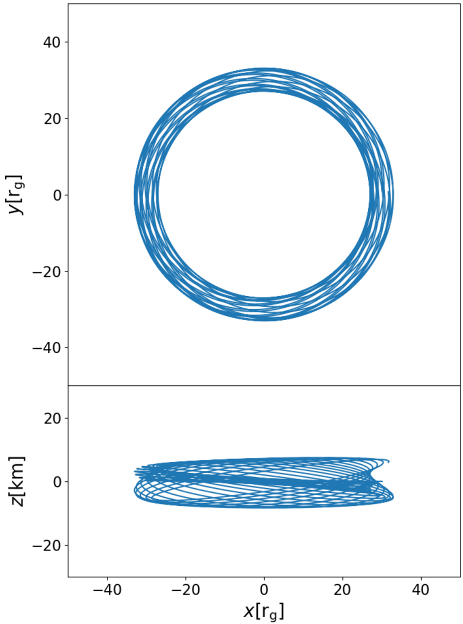
(*Mathisson 1937, Papetrou 1951, Dixon 1974*)

Equations are indeterminate

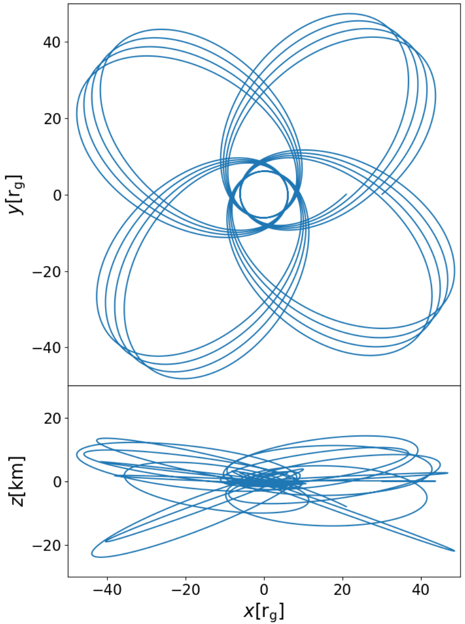
Spin Couplings

- Spin-spin
- Spin-orbit
- Spin-curvature

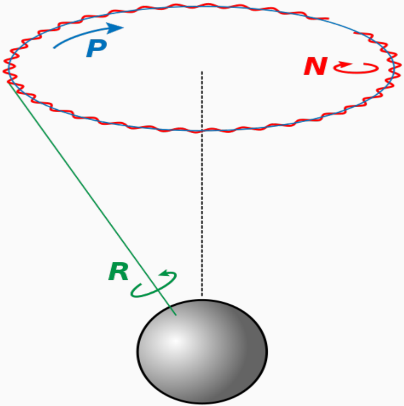
Orbital Dynamics: circular

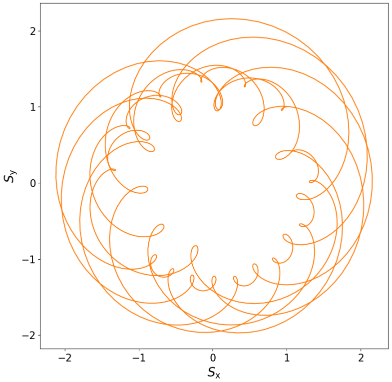


Orbital Dynamics: eccentric

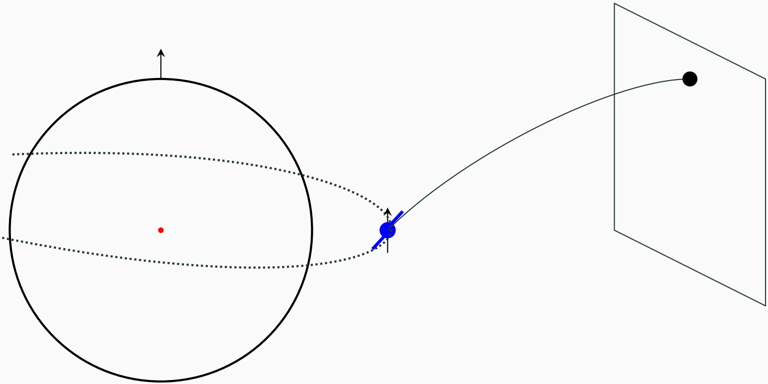


Spin Precession



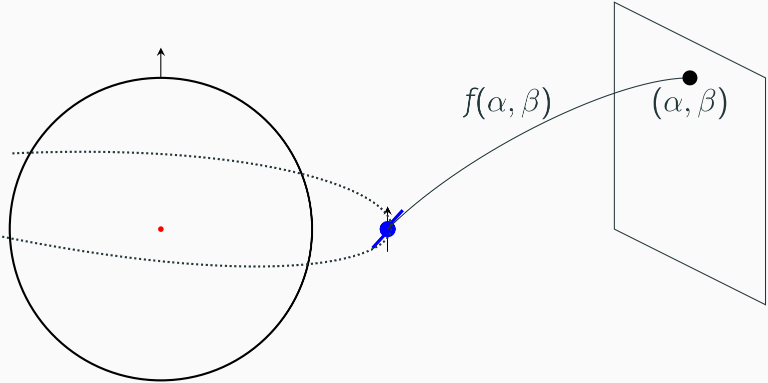


Putting it all together...



Behaviour of light + Orbital Dynamics = Timing signal

Putting it all together...



Behaviour of light + Orbital Dynamics = Timing signal

Optimization problem

$$f(\alpha, \beta)$$

Effects to consider

- Gravitational lensing
- Primary/Secondary rays
- Influence of plasma: temporal/spatial dispersion
- Gravitational/Relativistic time dilation
- Orbital Dynamics
- Spin-curvature coupling (+spin-spin, spin-orbit)
- Spin precession
- Relativistic aberration

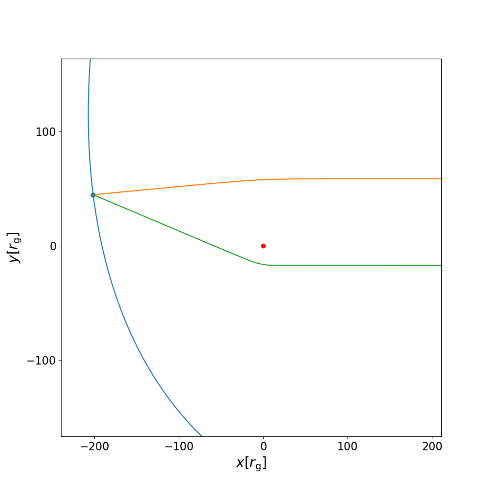
Photon ToA, pulse profile, intensity, observability

Effects to consider

- Gravitational lensing
- Primary/Secondary rays
- Influence of plasma: temporal/spatial dispersion
- Gravitational/Relativistic time dilation
- Orbital Dynamics
- Spin-curvature coupling (+spin-spin, spin-orbit)
- Spin precession
- Relativistic aberration

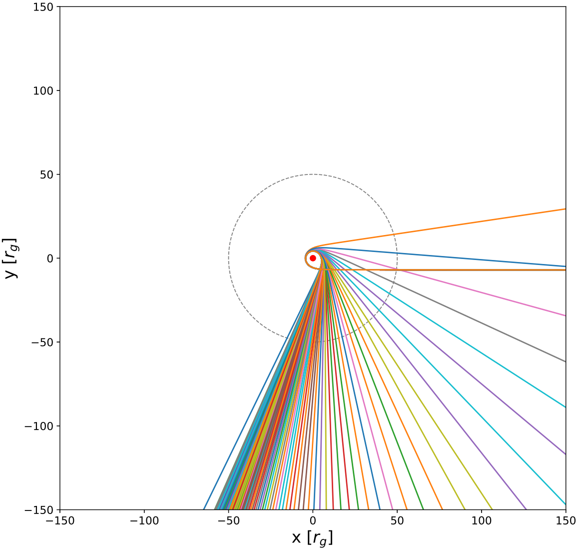
Photon ToA, pulse profile, intensity, observability

Gravitational Bending



- Deviation from straight lines
- Primary/Secondary Rays

Plasma: spatial dispersion



Summary

- PSR-EMRB = precision strong-gravity probes
- Require fully relativistic $t - \nu$ model
- Open question: How good are current methods?

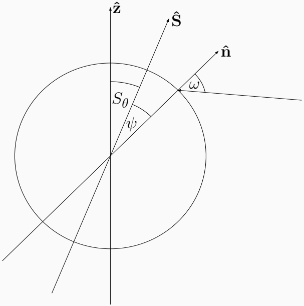
Questions?

Putting it all together...

- Pulsar emission $\neq$ isotropic
- Find intersection with radiation point $x^i_{\mathrm{rad}} = R_{\mathrm{PSR}}\hat{\mathsf{n}} + x^i_{\mathrm{pulsar}}$
- $\hat{\mathsf{n}} = \hat{\mathsf{n}}(S_\theta(\tau), \psi)$



Aberration

- 'Seen' if $\omega < \omega_c$
- Global $\omega \neq$ Local ω
- Transform to coming frame
